Lists and Tuples

Exercises

W	e	e	k	6
---	---	---	---	---

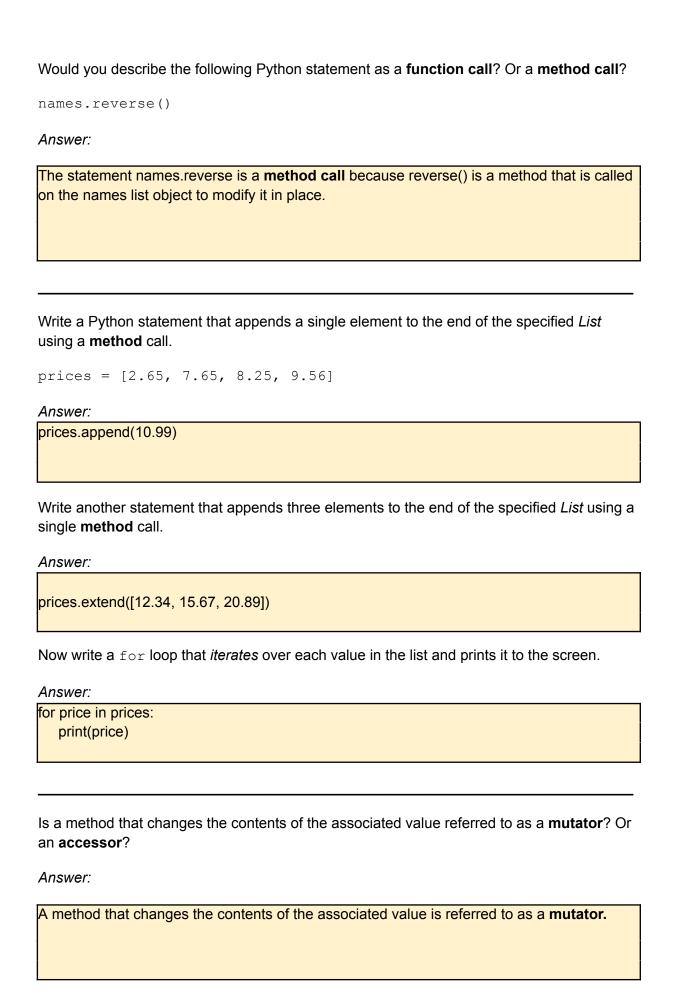

Prior to attempting these exercises ensure you have read the lecture notes and/or viewed the video, and followed the practical. You may wish to use the Python interpreter in interactive mode to help work out the solutions to some of the questions.

Download and store this document within your own filespace, so the contents can be edited. You will be able to refer to it during the test in Week 7.

Enter your answers directly into the highlighted boxes.

For more information about the module delivery, assessment and feedback please refer to the module within the MyBeckett portal.

What would the contents of the primes list look like after execution of the following statements?

```
primes = [ 2, 3, 5, 7, 11, 13, 17, 19 ]
primes.pop()
```

Answer:

```
[2, 3, 5, 7, 11, 13, 17]
```

primes.reverse()

Answer:

```
[17, 13, 11, 7, 5, 3, 2]
```

primes.remove(7)

Answer:

[17, 13, 11, 5, 3, 2]

Provide an example of how the insert() method could be used to add a value of 10 to the beginning of the list shown below.

```
temps = [32, 46, 95, 10, 50]
```

Answer:

temps.insert(0, 10)

Now write a statement that uses an *accessor* method to find the index of the value 95 within the list.

Answer:

index_of_95 = temps.index(95)

Finally write a statement that uses another *accessor* method to count how many times the number 10 appears within the list.

Answer:

```
count_of_10 = temps.count(10)
```

What would be stored in the list samples after the following statements were executed?

```
samples = [ 100.2, 100.6, 99.2, 765.2, 900.2, 400 ]
samples = samples.reverse()
```

Answer:

When the reverse() method is called on the list, it will reverse the elements of the list in place. After executing the given statements, the list samples will be modified to: [400, 900.2, 765.2, 99.2, 100.6, 100.2]

Explain why this is the case.

Answer:

The reverse() method reverses the elements of a list in place, meaning it modifies the original list directly. After executing samples.reverse, the order of elements in samples is reversed, so the list becomes [400, 900.2, 765.2, 99.2, 100.6, 100.2].

Write a Python program that uses a **List-Comprehension** to produce the same list as the following code -

```
values = []
for n in range(100,200):
     values.append(x*x)
```

Answer:

```
values = [x * x \text{ for } x \text{ in range}(100, 200)]
```

Now, amend your code so that it only includes even numbers.

Answer:

```
values = [x * x for x in range(100, 200) if x % 2 == 0]
```

What is the data-type of the following value?

info = ("Ken", "bae-192", 62)

Answer:

Tuple

Is a Tuple mutable or immutable?

Answer:

immutable

Write a statement that creates a Tuple that contains a single element.

Answer:

singleElementTuple = (84,)

Write a single Python statement that **unpacks** the following Tuple into three variables, called x, y and z.

```
coord = (100, 200, 150)
```

Answer:

```
x, y, z = coord
```

Write another statement that uses indexing to access the second element of the Tuple and store it in a variable called 'height'

Answer:

```
height = coord[1]
```

Finally write a 'for' loop that prints each value within the Tuple.

Answer:

for value in coord: print(value)	
When a Tuple (or any sequence) type value is being passed as an argument to a function what single character can be used as a prefix to force the sequence to be unpacked pri	

Answer:

the call being made?

The asterisk(*) prefix.

When discussing Tuples the phrase **heterogeneous** is sometimes used to describe the type of stored values. What does this mean in practice?

Answer:

Heterogeneous means a tuple can hold elements of various data types, like integers, strings, floats, or even other tuples or lists.

What sister phrase is often used to refer to the type of values stored within a List? And what does this mean?

Answer:

The sister phrase "homogeneous" refers to a list typically containing elements of the same data type, though mixed types are also allowed.
